The background of the slide is composed of a grid of hexagons. Each hexagon contains a different digital-themed pattern, including binary code (0s and 1s), network diagrams with nodes and lines, and abstract blue and white geometric shapes. The overall color palette is dominated by light blue, white, and dark blue.

Digital Footprints: What can be learned from the traces we leave on social networks

And these residents?

Metadata is Data

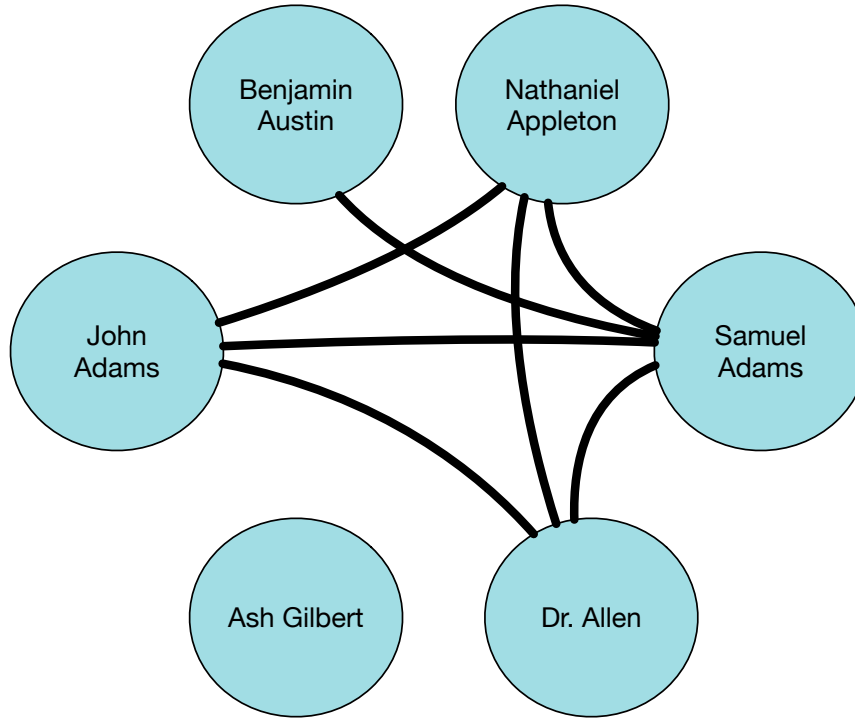

Just 3 pieces of information

- Sender
- Recipient
- Date

That's enough for
social network analysis.

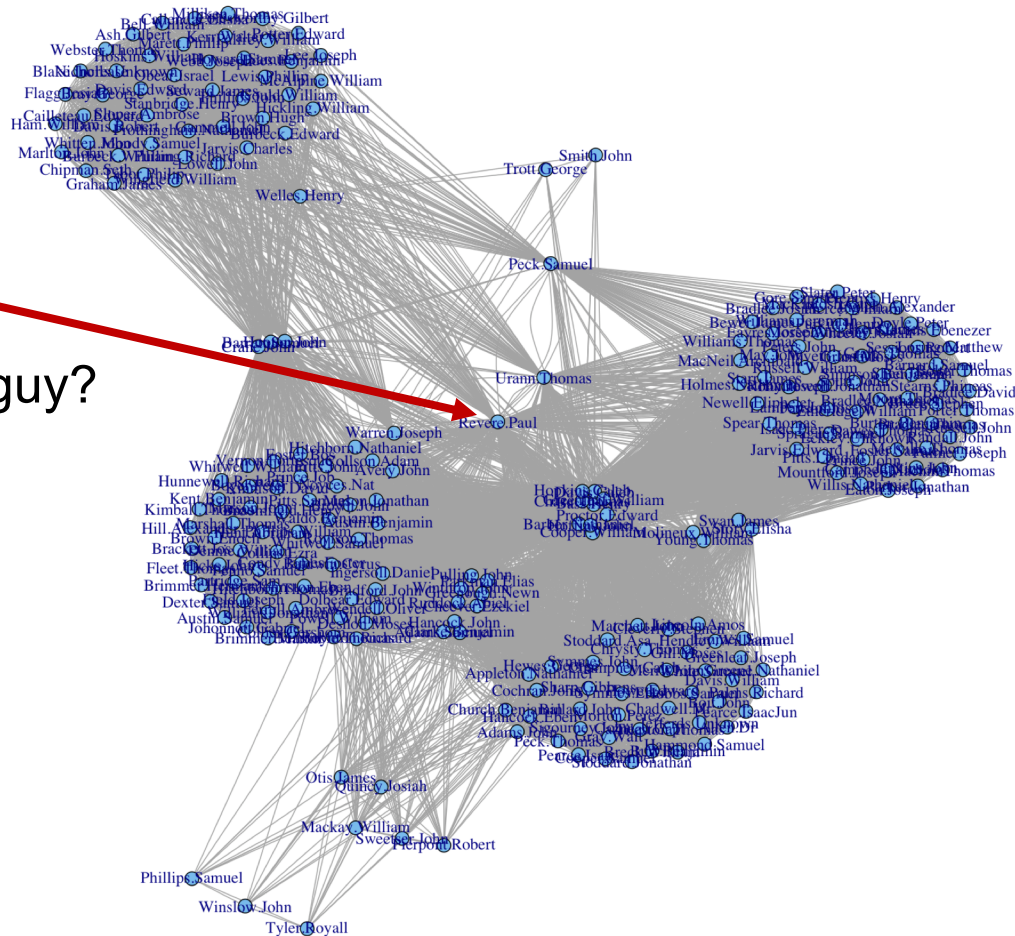

Boston, 1772 – A piece of the picture.

This example is due to Kieran Healy:
<https://kieranhealy.org/blog/archives/2013/06/09/using-metadata-to-find-paul-revere/>

Boston, 1772

Wait, Who's this guy?

Boston, 1772

With 3 pieces of information and minimal calculations, we've identified a figure central in the “uprising” of 1776.

Private traits and attributes are predictable from digital records of human behavior

Michal Kosinski^{a,1}, David Stillwell^a, and Thore Graepel^b

^aFree School Lane, The Psychometrics Centre, University of Cambridge, Cambridge CB2 3RQ United Kingdom; and ^bMicrosoft Research, Cambridge CB1 2FB, United Kingdom

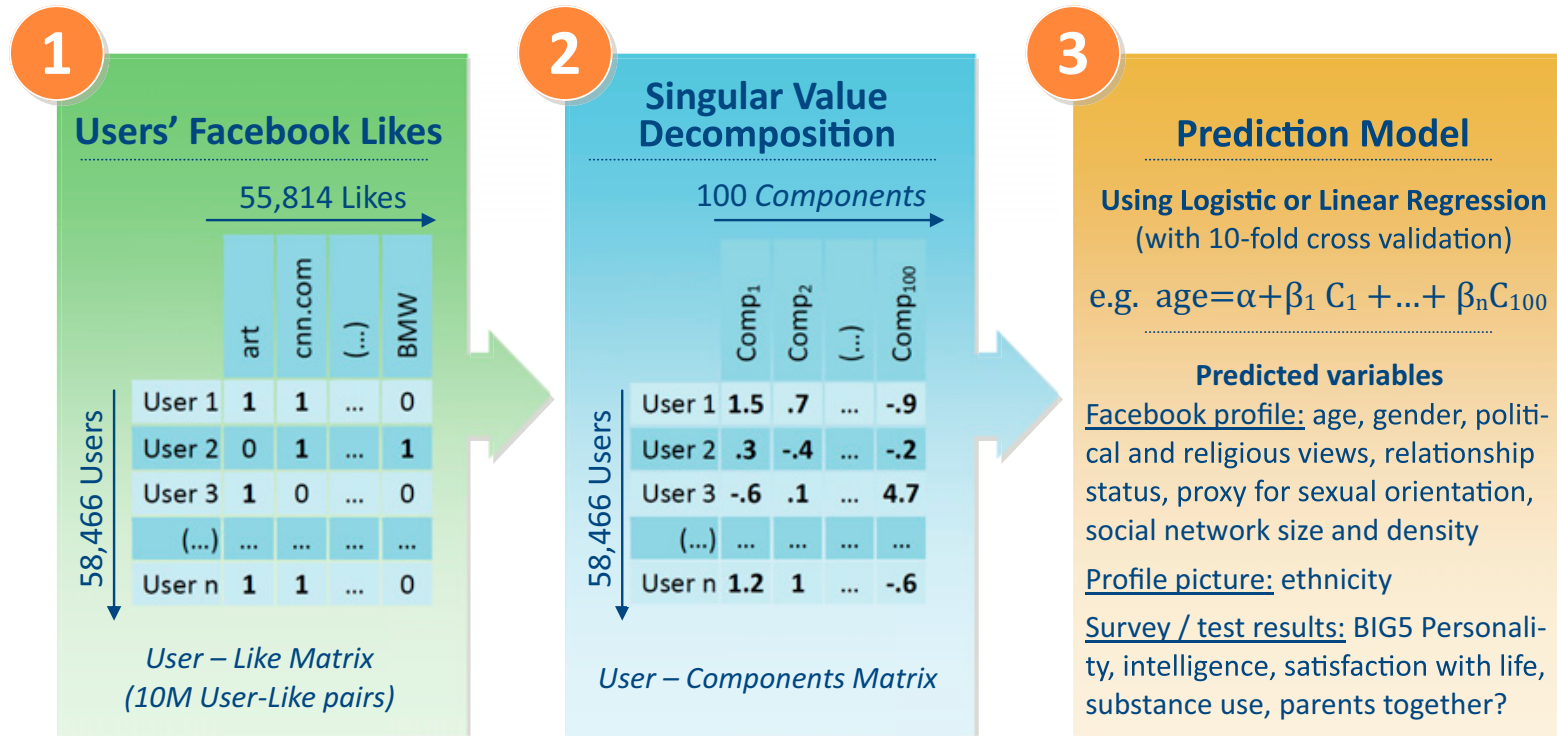

Edited by Kenneth Wachter, University of California, Berkeley, CA, and approved February 12, 2013 (received for review October 29, 2012)

We show that easily accessible digital records of behavior, Facebook Likes, can be used to automatically and accurately predict a range of highly sensitive personal attributes including: sexual orientation, ethnicity, religious and political views, personality traits, intelligence, happiness, use of addictive substances, parental separation, age, and gender. The analysis presented is based on a dataset of over 58,000 volunteers who provided their Facebook Likes, detailed demographic profiles, and the results of several psychometric tests. The proposed model uses dimensionality reduction for preprocessing the Likes data, which are then entered into logistic/linear regression to predict individual psychodemographic profiles from Likes. The model correctly discriminates between homosexual and heterosexual men in 88% of cases, African Americans and Caucasian Americans in 95% of cases, and between Democrat and

browsing logs (11–15). Similarly, it has been shown that personality can be predicted based on the contents of personal Web sites (16), music collections (17), properties of Facebook or Twitter profiles such as the number of friends or the density of friendship networks (18–21), or language used by their users (22). Furthermore, location within a friendship network at Facebook was shown to be predictive of sexual orientation (23).

This study demonstrates the degree to which relatively basic digital records of human behavior can be used to automatically and accurately estimate a wide range of personal attributes that people would typically assume to be private. The study is based on Facebook Likes, a mechanism used by Facebook users to express their positive association with (or “Like”) online content, such as photos, friends’ status updates, Facebook pages of prod-

The Netflix Prize

The image shows a screenshot of the Netflix Prize website. The top navigation bar is red with the 'NETFLIX' logo in white. Below it is a yellow banner with the text 'Netflix Prize' in large white letters and a red 'COMPLETED' stamp in the top right corner. A navigation bar below the banner contains links: 'Home', 'Rules', 'Leaderboard', and 'Update'. The main content area is dark and shows a 'Movies For You' section with a recommendation for 'Randy, the following movies were chosen based on your interest in: Bowling for Columbine'. A white box on the right side of the page contains the text 'Congratulations!' in blue, followed by a paragraph explaining the prize.

Movies For You

Randy, the following movies were chosen based on your interest in: Bowling for Columbine

Congratulations!

The Netflix Prize sought to substantially improve the accuracy of predictions about how much someone is going to enjoy a movie based on their movie preferences.

How To Break Anonymity of the Netflix Prize Dataset

Arvind Narayanan, Vitaly Shmatikov

(Submitted on 18 Oct 2006 (v1), last revised 22 Nov 2007 (this version, v2))

We present a new class of statistical de-anonymization attacks against high-dimensional micro-data, such as transaction records and so on. Our techniques are robust to perturbation in the data and tolerate some mistakes. We apply our de-anonymization methodology to the Netflix Prize dataset, which contains anonymous movie rental records from the world's largest online movie rental service. We demonstrate that an adversary who knows only a little bit about this subscriber's record in the dataset. Using the Internet Movie Database as the source of background knowledge, records of known users, uncovering their apparent political preferences and other potentially sensitive information.

Subjects: **Cryptography and Security (cs.CR)**; Databases (cs.DB)

Cite as: **arXiv:cs/0610105 [cs.CR]**

(or **arXiv:cs/0610105v2 [cs.CR]** for this version)

The record of movies you watch is a fingerprint

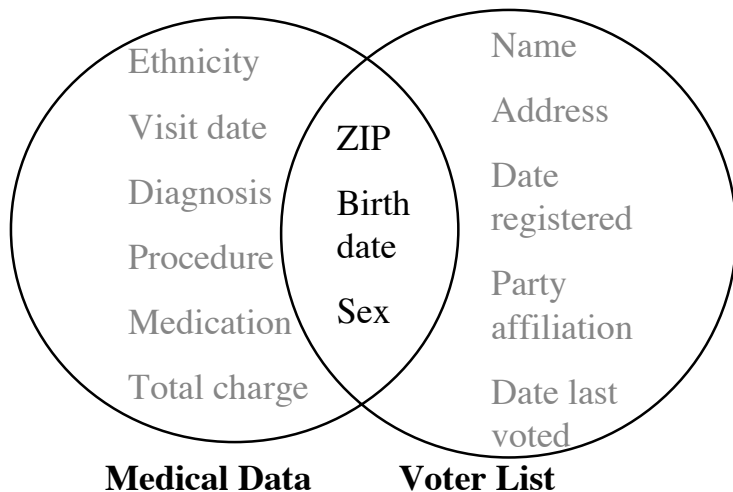

68% of records can be re-identified with 2 movie ratings and dates accurate to within 3 days

99% of records can be re-identified with 8 movie ratings (2 of which might be wrong) and dates accurate to within 2 weeks.

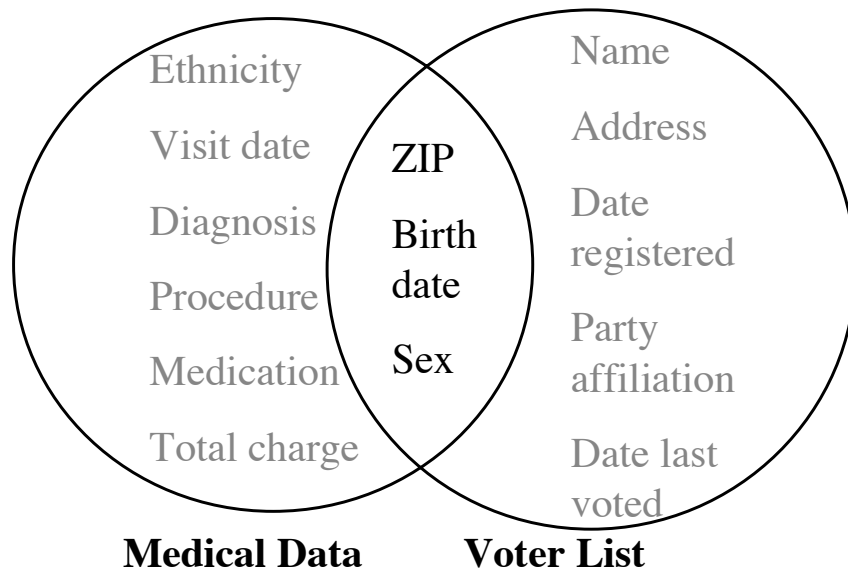

Figure 1: De-anonymization: adversary knows exact ratings and approximate dates.

Health Records

1997, Group insurance commission released *anonymized* health records from Massachusetts.

Health Records

Sweeny (2002), identified Governor Weld's medical records:

- 6 people shared his birth date
- Only 3 were men
- He was the only one in his zip code.

There are Real Consequences

There are real consequences

Marketing for the wrong products

- Annoyance for most of us
- Reveals a medical condition at work

Someone gets categorized as “Diabetes Interest”

- Ads for sugar- free products?
- High risk insurance category?

There are real consequences

Facilitates

- harassment
- stalking,

Exposes

- domestic violence victims,
- law enforcement officers,
- prosecutors,
- public officials
- ...

Real Consequences

Real personal information, including

- Names
- Addresses
- Social security numbers,
- Bank account numbers

Attached to fake debts.

Packaged and sold to debt collectors.

Disabling Third-Party Cookies

First-party cookies are generally not harmful, don't need to be turned off

Third-party cookies can be disabled in each browser you use

Details vary based on which browser you use. E.g. some browsers only disable *setting* third-party cookies but don't disable *reading*

Browser fingerprinting

Websites ask your browser for information about itself and your computer so that content can be displayed most effectively, e.g.

What browser and operating system are in use?

What plugins are installed?

What is the screen resolution and color depth?

What fonts are installed?

This information can be used to **uniquely identify you**.

Browser fingerprinting

Are you unique?

Yes! (You can be tracked!)

3.44 % of observed browsers are **Safari**, as yours.

0.12 % of observed browsers are **Safari 11.0.2**, as yours.

13.23 % of observed browsers run **Mac**, as yours.

3.52 % of observed browsers run **Mac 10.12**, as yours.

62.65 % of observed browsers have set **"en"** as their primary language, as yours.

4.73 % of observed browsers have **UTC-4** as their timezone, as yours.

However, your full fingerprint is unique among the 714241 collected so far. Want to know why?

[Click here](#)

In one study, **79.4%** of fingerprints were unique
