

CERT® Operational Resilience: MANAGE, PROTECT, AND SUSTAIN

1.23.14 • 8:30 am ET–5:00 pm ET

Overview of the CERT® Resilience Management Model (CERT®-RMM)

Jim Cebula

Technical Manager - Cyber Risk Management, CERT® Division

Jim Cebula is the Technical Manager of the Cyber Risk Management team in the Cyber Security Solutions Directorate of the CERT Division at the Software Engineering Institute (SEI), a unit of Carnegie Mellon University.

Cebula's current activities include risk management methods along with assessment and management of operational resilience among Federal departments and agencies as well as critical infrastructure and key resource (CIKR) providers. He is the co-author of the Taxonomy of Operational Cyber Security Risks, and has instructed courses in the OCTAVE method. He is also currently a co-PI on a research initiative studying perceptions of risk. He joined CERT in 2009 after spending nearly fifteen years in project management, IT and security roles supporting government agencies, most recently as a cyber security manager.

CERT® Resilience Management Model (CERT-RMM)

Framework for managing and improving operational resilience

“...an extensive super-set of the things an organization could do to be more resilient.”

What is CERT-RMM?

Guides implementation and management of operational resilience activities

Enables and promotes the **convergence** of

- Business Continuity, COOP, IT disaster recovery
- Information security, cybersecurity
- IT operations

Applicable to a variety of organizations

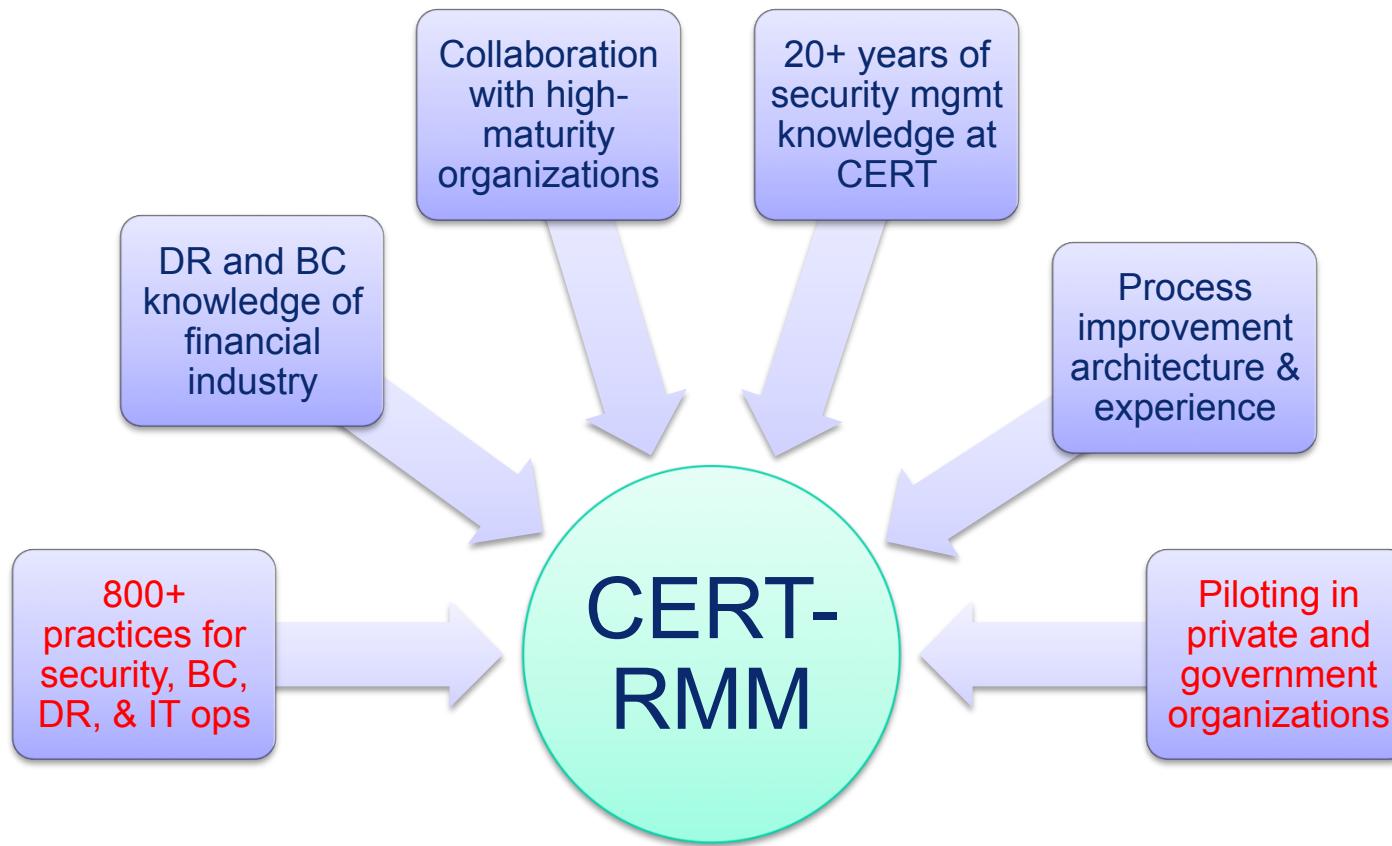

- small or large
- simple or complex
- public or private

Software Engineering Institute

Carnegie Mellon University

How was CERT-RMM developed?

CERT-RMM codifies best practices for info. sec., IT DR, and BC from world leading organizations and numerous standards and codes of practice.

What drove development of CERT-RMM?

Increasingly complex operational environments

Siloed nature of operational risk activities

Lack of common language or taxonomy

Overreliance on technical approaches

Lack of means to measure organizational capability

Inability to confidently predict outcomes, behaviors, and performance under times of stress

CERT-RMM – The Model

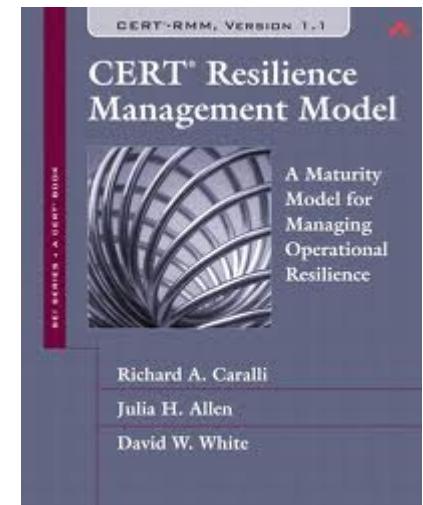

Guidelines and practices for

- converging of security, business continuity, disaster recovery, and IT ops
- implementing, managing, and sustaining operational resilience activities
- managing operational risk through process
- measuring and institutionalizing the resilience process

Common vernacular and basis for planning,
communicating, and evaluating improvements

Focuses on “what,” not “how”

Organized into 26 process areas

RISK

1. An event or condition
2. A consequence or impact from the condition
3. An uncertainty

The possibility of suffering a harmful event

Exposure to the chance of injury or loss

The possibility of suffering harm or loss

A source of danger

Operational Risk Management

A form of risk affecting day-to-day business operations

A very broad risk category

- from high-frequency, low-impact to low-frequency, high-impact

Types of Operational Risks

- actions of people
- systems and technology failures
- failed internal processes
- external events

Operational resilience emerges from effective management of operational risk.

Hurdles to Effective Operational Risk & Resilience Mgmt.

Vague and abstract nature

Compartmentalization

Technology focus

Practice proliferation

Insufficient funding

Insufficient success metrics

Discrete nature of activity

(Over)reliance on people

- Convergence
- Organizational Construct for Resilience Activities

- Protection and Sustainment Activities
- Institutionalization
- Lifecycle View
- Code of Practice Crosswalk

Convergence

A fundamental concept in managing operational resilience

Refers to the harmonization of operational risk management activities that have similar objectives and outcomes

Operational risk management activities include (but are not limited to)

- security planning and management
- business continuity and disaster recovery
- IT operations and service delivery management

Other support activities may also be involved

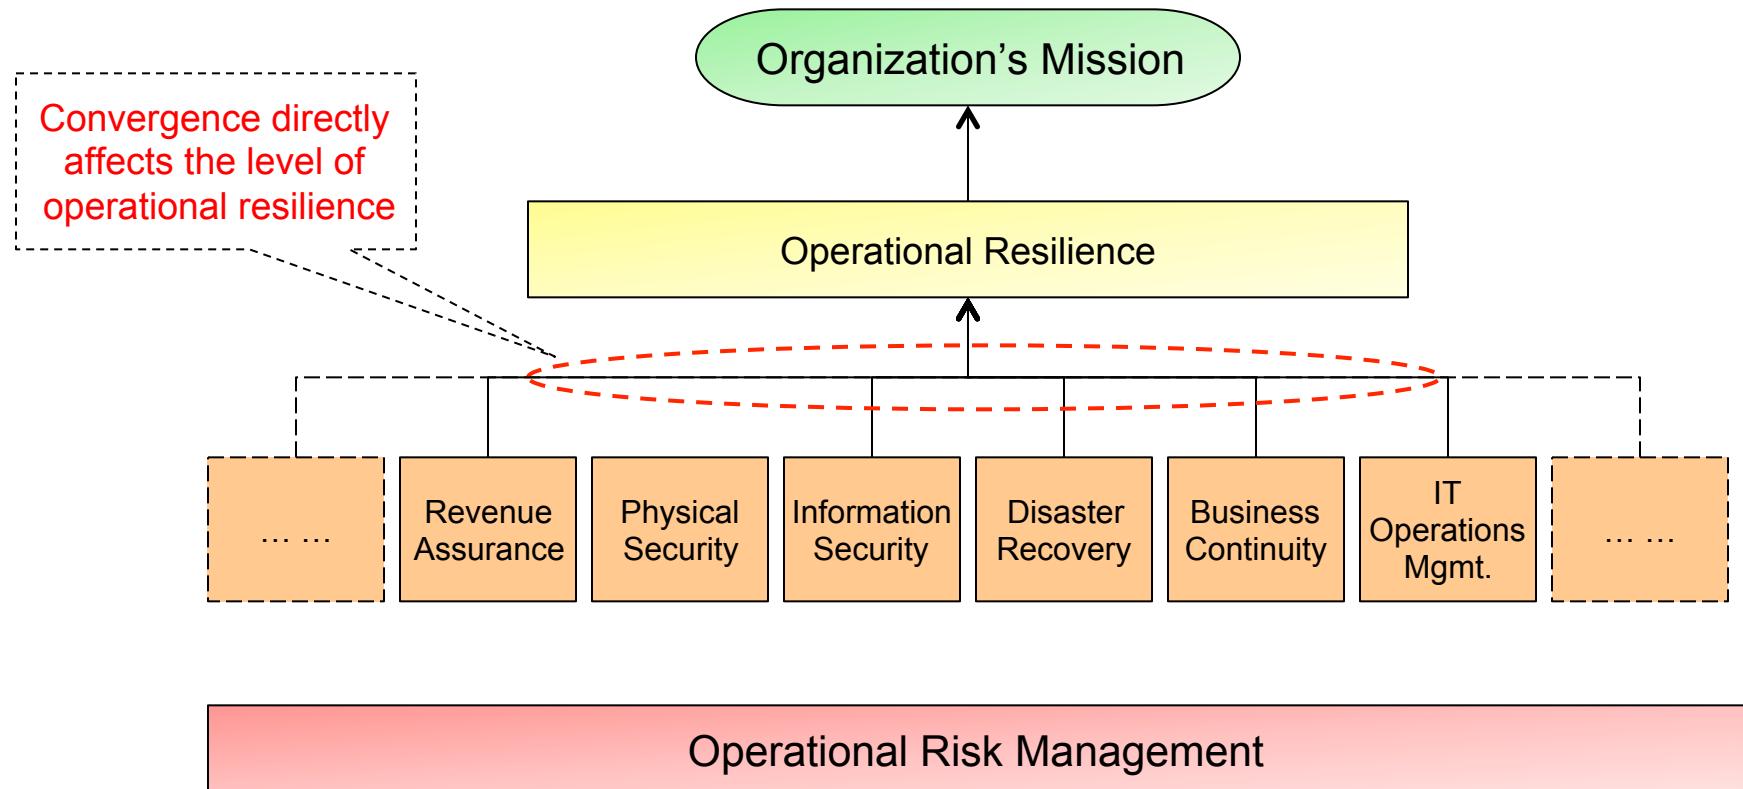

- communications
- financial management
- etc.

Software Engineering Institute

Carnegie Mellon University

Convergence

Benefits of Convergence and Integration

Similar activities are bound by the same risk drivers

Allows for better alignment between risk-based activities and organizational risk tolerances and appetite

Eliminates redundant activities (and associated costs)

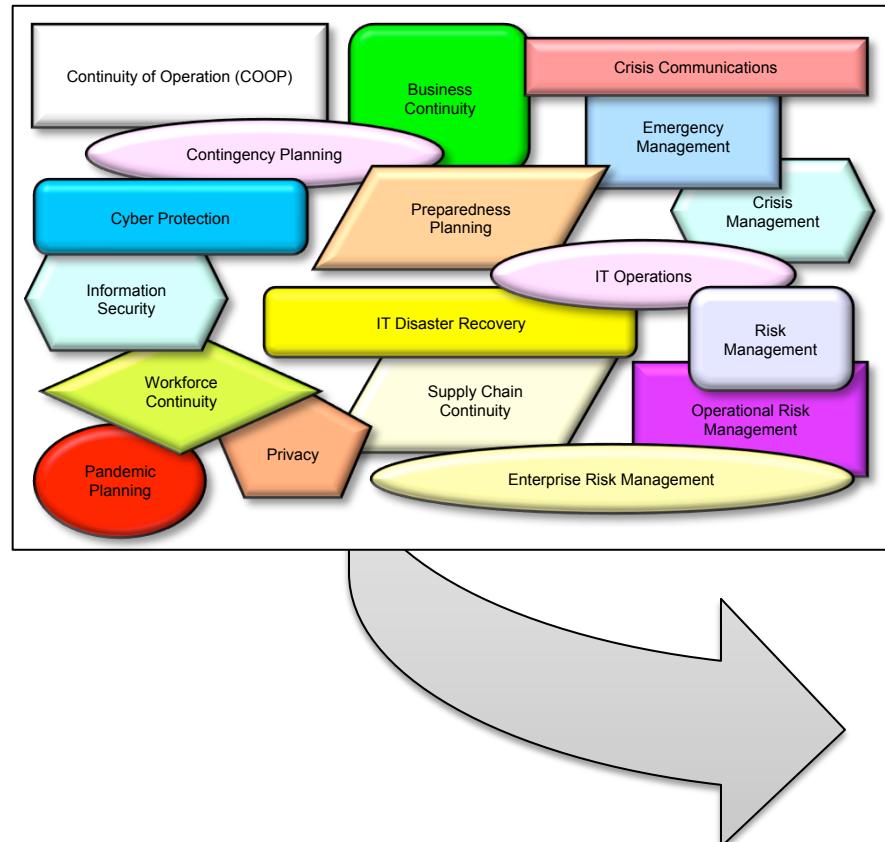

Forces collaboration between activities that have similar objectives

Enforces a mission focus

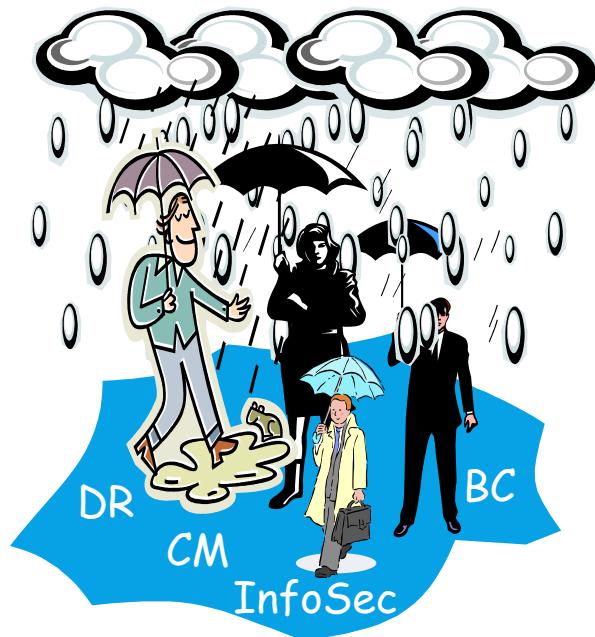

Facilitates a process that is owned across the organization

Influences how operational risk and resilience management work is planned, executed, and managed

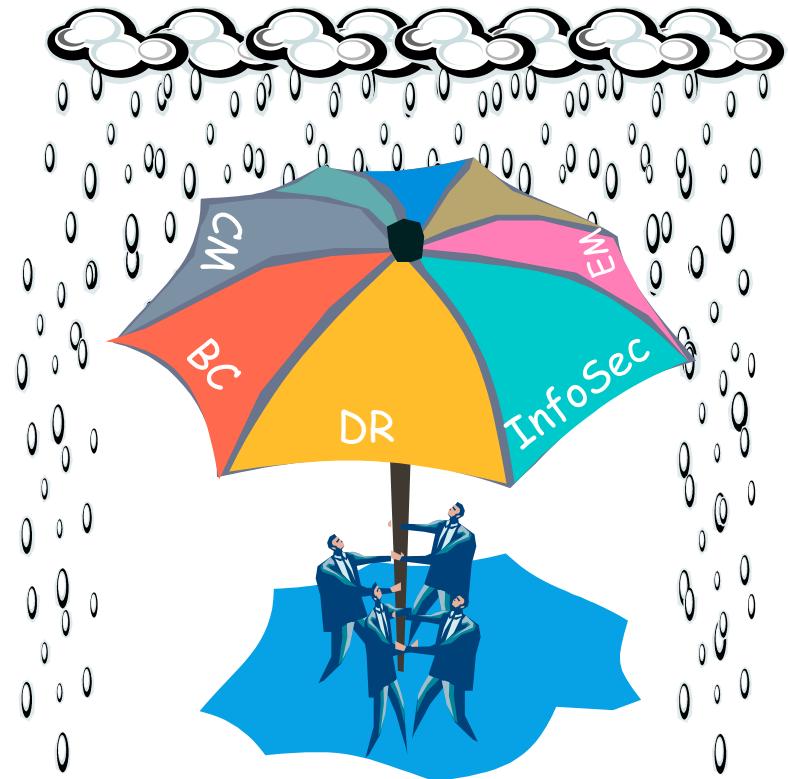

Desired Integrated Approach

Desired Integrated Approach

Convergence

Enemies of Convergence

Organizational structures

Traditional funding models

Overuse and misuse of codes of practice

Unclear or poorly defined and communicated risk drivers

Unclear or poorly defined enterprise objectives, strategic objectives, and critical success factors

Lack of supporting process orientation and definition

Lack of sponsorship and governance for the process

Lack of a risk-aware culture

CERT-RMM Combines Two Approaches

Operational Resilience Management System

What to do

Comprehensive non-prescriptive guidance on what to do to manage operational resilience

Process Dimension

Process Institutionalization and Improvement

Making it stick

Proven guidance for institutionalizing processes so that they persist over time

Capability Dimension

Institutionalizing a Culture of Resilience

institutionalize *verb* (CUSTOM) (UK USUALLY **institutionalise**) **UK** 
US  /,ɪn.tɪ'strɪ.tju:ʃən.ə.laɪz/ **US** /-'tu:-/ [T]

to make something become part of a particular society, system, or organization

What was once an informal event has now become institutionalized.

Organizations must provide explicit guidance for institutionalizing resilience activities so that they persist over time.

Ask not “how well am I performing today?”

Ask “do I have what it takes to sustain high performance beyond today?”

Lifecycle View

To improve and sustain an entity's operational resilience, it is not sufficient to improve only protection and sustainment activities.

Resilience should not be an afterthought bolt-on.

Resilience should be engineered and built in.

Resilience Management is a Total Lifecycle Concept.

SERVICE CONTINUITY

Purpose

The purpose of Service Continuity is to ensure the continuity of essential operations of services and related assets if a disruption occurs as a result of an incident, disaster, or other disruptive event.

Introductory Notes

The continuity of an organization's service delivery is a paramount concern in the organization's operational resilience activities. The organization can invest considerable time and resources in attempting to prevent a range of potential disruptive events, but no organization can mitigate all risk. As a result, the organization must be prepared to deal with the consequences of a disruption to its operations at any time. Significant disruption can result in dire circumstances for the organization, even bankruptcy or termination.

Summary of Specific Goals and Practices

SC:SG1 Prepare for Service Continuity

- SC:SG1.SP1 Plan for Service Continuity
- SC:SG1.SP2 Establish Standards and Guidelines for Service Continuity

SC:SG2 Identify and Prioritize High-Value Services

- SC:SG2.SP1 Identify the Organization's High-Value Services
- SC:SG2.SP2 Identify Internal and External Dependencies and Interdependencies
- SC:SG2.SP3 Identify Vital Organizational Records and Databases

SC:SG3 Develop Service Continuity Plans

- SC:SG3.SP1 Identify Plans to Be Developed
- SC:SG3.SP2 Develop and Document Service Continuity Plans
- SC:SG3.SP3 Assign Staff to Service Continuity Plans
- SC:SG3.SP4 Store and Secure Service Continuity Plans
- SC:SG3.SP5 Develop Service Continuity Plan Training

SC:SG4 Validate Service Continuity Plans

- SC:SG4.SP1 Validate Plans to Requirements and Standards
- SC:SG4.SP2 Identify and Resolve Plan Conflicts

Example: Service Continuity Process Area

SC:SG2.SP1 IDENTIFY THE ORGANIZATION'S HIGH-VALUE SERVICES

The high-value services of the organization and their associated assets are identified.

The identification and prioritization of the organization's high-value services as strategic planning activities are addressed in the Enterprise Focus process area. This practice is included here to emphasize the importance of prioritizing high-value services as a foundation for the other process areas.

Typical work products

1. Prioritized list of high-value organizational services, activities, and associated assets
2. Results of security risk assessment and business impact analyses

Subpractices

1. Identify the organization's high-value services, associated assets, and activities.
2. Analyze and document the relative value of providing these services and the resulting impact on the organization if these services are interrupted.

Consideration of the consequences of the loss of high-value organizational services is typically performed as part of a business impact analysis. In addition, the consequences of risks to high-value services are identified and analyzed in risk assess-

Distinguishing Features of CERT-RMM

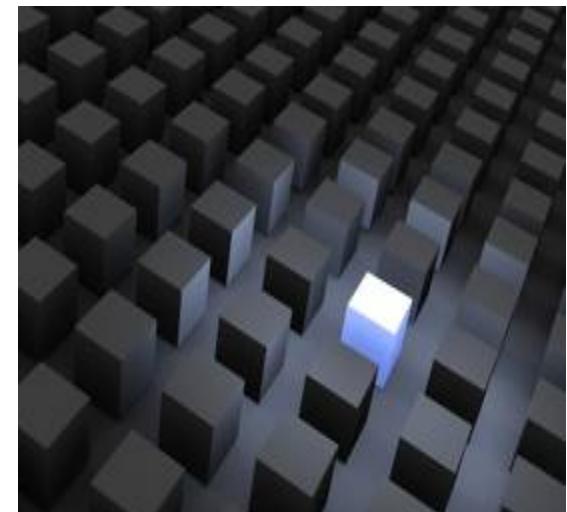

Converges key operational risk management activities: security, BC/DR, and IT operations

Guides **implementation and management** of operational resilience activities

Descriptive rather than prescriptive:
focuses on the “what,” not the “how”

Provides an organizing convention for effective selection and deployment of codes of practice and standards

Guides improvement in areas where an organization’s capability does not equal its desired state
